

Wig Sales & Profit Analytics

Business Insights & Recommendations

Project Overview

This practice project analyzes a fictional wig-sales dataset to demonstrate the complete Excel analytics workflow: data cleaning, exploration, analysis, visualization and business interpretation.

Key Findings

- 1. Closure Wig led sales volume.** Closure Wig recorded 38 units sold, the highest quantity in the dataset.
- 2. Closure Wig generated the highest revenue.** Closure Wig contributed approximately **■5.13M**, slightly ahead of Human Hair at approximately **■5.04M**.
- 3. Human Hair generated the highest total profit.** Human Hair generated approximately **■1.96M** in profit despite not having the highest sales volume.
- 4. Q2 was the strongest quarter.** Revenue peaked at approximately **■11M** in Q2 before declining in Q3 and Q4.
- 5. Overall performance.** Total revenue was approximately **■30.13M** and total profit approximately **■10.75M**, giving an overall profit margin of about 35.7%.

Business Interpretation

Sales volume, revenue and profitability tell different stories. Closure Wig was strongest by units and revenue, while Human Hair was strongest by total profit. Product decisions should therefore consider demand and profitability together.

Recommendations

- **Prioritize high-demand inventory:** Monitor high-volume products such as Closure Wig to reduce potential stockouts.
- **Protect high-profit products:** Investigate the factors contributing to Human Hair's strong profitability.
- **Investigate Q2:** Review promotions, pricing, product availability, demand and marketing activity to understand the revenue spike.
- **Use multiple metrics:** Evaluate products using quantity sold, revenue and profit rather than one measure alone.

Important Note

These findings describe the fictional practice dataset used for this portfolio project. The dataset does not represent a real salon. The dashboard identifies patterns but does not establish their causes; further investigation would be required.
